

The Energy Reality Project is the result of recognizing the lack of understanding of energy in general and how nuclear energy is being maligned and misrepresented. Energy needs to be discussed in a realistic way that takes into account what science has achieved. If the goal of science is to make a better future then we need to give science the respect it deserves. Nuclear power from fission may be our only hope.

The reality of science explains that we cannot exclude nuclear science and nuclear energy. The biggest obstacle for acceptance of nuclear is a matter of education. The urgency and necessity to get results, in light of an impending energy crisis and irreversible environmental and ecological emergency, has been made by, futurists, economists, oceanographers and ecologists. We need to regain a vision of prosperity and seek a quality of life where abundance is permitted, enjoyed and seen as a source of inspiration.

We plan to provide outreach and a context of where nuclear fits in the larger picture. The pinnacle of scientific achievement is nuclear science. Nuclear is here to stay. It needs to be taught more fully and it's benefits widely shared. Being pro-active is an important concept in our efforts to advocate for a better understanding.

Goals of the Project - <http://EnergyRealityProject.com>

1. Acknowledge the pros and cons of each type of energy source.
2. Compare the various "Energy Types" for electricity and other purposes and demonstrate what energy source is a best match for various locales and locations.
3. Explore energy sources as complimentary in a mix, what does and doesn't work.
4. Deliver informed & respectful dialogue to cut through biases & misconceptions;
5. To set up a learning resource for both the information seekers such as journalists, the general public or students and information givers such as the news media and teachers.

To be part of the team to make this project a success contact
